

# Renewable Energy

Ingram Micro is a global leader in technology and supply chain services and plays an integral role in a global supply chain that moves technology products from manufacturers to end customers. Across our lines of business, we employ approximately 28,000 associates, ship approximately 1.5 billion units per year, represent more than 1,500 vendors and serve more than 170,000 customers in approximately 200 countries.

We use electricity and natural gas for lighting, cooling, heating and equipment use in our offices, warehouses and distribution centers. In 2021, we used 231,270 MWh of energy from electricity and natural gas, which resulted in 16,326 metric tons (MT) CO<sub>2</sub>e of Scope 1 emissions and 44,129 MT CO<sub>2</sub>e of Scope 2 emissions. We are committed to taking proactive measures to reduce the impact of energy use in our operations.

## Our Strategy

In 2021, we completed our Global Renewable Energy Roadmap, which outlines strategies for our approach to procuring renewable electricity. We will be leveraging this roadmap as we continue to increase our procurement of renewable energy.

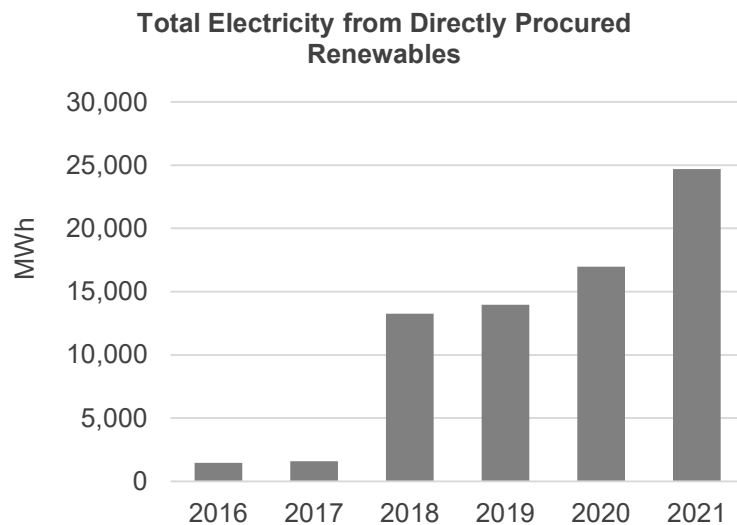

In the near term, we will focus on purchasing 100% renewable energy through retail markets where this option is available. We may also engage in direct transactions for offsite renewables through power purchase agreements (PPAs). Finally, we will consider purchase of renewable energy credits (RECs) and similar instruments to offset the emissions of our operating locations where we are not otherwise able to directly procure renewable electricity.

Almost all the real estate we occupy is leased, which makes it difficult for us to deploy onsite renewables at scale as we do not own or control the roofs or other spaces at our locations. We do seek opportunities to develop onsite solar where feasible.

### Renewable Electricity and REC Purchasing

We procured more than 16 times as much renewable energy in 2021 compared to that of 2016, as shown in the graph to the right. In fact, in 2021 approximately 17% of our total electricity came from

direct procurement of renewable sources. This, of course, does not account for the renewable electricity present in our consumption of grid electricity.

In 2021, we converted six additional sites in North America (NA) and Europe, Middle East and Africa (EMEA) regions to 100% renewable energy supply.

## Onsite Solar

Currently we have three active sites where we use onsite solar to power our operations. We also occupy a few other buildings which have on-premises solar, however at these locations the electricity is delivered to the grid or to another customer. We are actively exploring opportunities to increase our use of onsite solar and investigating ways to encourage our landlords to support solar-powered and solar-ready building projects.

In April 2020, our Zevenheuvelenweg, Netherlands site's 10,000-panel solar system was brought online with a total maximum capacity of 0.28 megawatts (MW).

*Eastern Creek Distribution Center in Sydney, Australia*

In 2021, solar panels were added to the roof of another site in the Netherlands at our warehouse in Tilburg. At our Eastern Creek distribution center in Sydney, Australia, a 0.3-MW solar panel system was installed, which alone reduced emissions by 121 MT CO<sub>2</sub>e per year.
